

①

### Question: 2

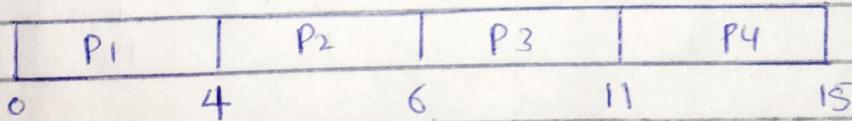

for the following set of processes, find average waiting time & average turn around time using Gantt chart for:

i: FCFS:

**First Come First Serve (FCFS):**

Process	Arrival time	Burst time
P <sub>1</sub>	0	4
P <sub>2</sub>	1	2
P <sub>3</sub>	2	5
P <sub>4</sub>	3	4

**Gantt chart:**

Process	Arrival time	Burst time	Completion time	Turn Around Time	Waiting Time
P <sub>1</sub>	0	4	4	4	0
P <sub>2</sub>	1	2	6	5	3
P <sub>3</sub>	2	5	11	9	4
P <sub>4</sub>	3	4	15	12	8

$$\text{Turn Around Time} = \text{Completion Time} - \text{Arrival Time}$$

$$\text{Waiting Time} = \text{Turn Around Time} - \text{Burst Time}$$

$$\text{Average Turn Around Time} = \frac{4+5+9+12}{4}$$

$$\text{Average waiting time} = \frac{30}{4} = 7.5$$

$$\text{Average waiting Time} = \frac{0+3+4+8}{4} = 3.75$$

ii) SJF (Non-preemptive):

Shortest job first (Non-preemptive):

Gantt chart:

	P1	P2	P4	P3	
	0	4	6	10	15

Process	Arrival time	Burst time	Completion time	Turn Around time	Waiting time
P1	0	4	4	4	0
P2	1	2	6	5	3
P3	2	5	15	13	8
P4	3	4	10	7	3

$$\text{Average Turn Around time} = \frac{4+5+13+7}{4}$$

$$= \frac{29}{4} = 7.25$$

(3)

$$\text{Average waiting time} = \frac{0+3+8+3}{4}$$

$$= 3.5$$

3

iii) SJF (Preemptive):

Shortest job first (Preemptive):

P <sub>1</sub>	P <sub>2</sub>	P <sub>3</sub>	P <sub>4</sub>	P <sub>1</sub>	P <sub>1</sub>
0	1	3	8	12	15

Process	Arrival time	Burst time	Completion time	Turn Around time	Waiting time
P <sub>1</sub>	0	4	15	15	11
P <sub>2</sub>	1	2	3	2	0
P <sub>3</sub>	2	5	8	6	1
P <sub>4</sub>	3	4	12	9	5

Average Turn around time

$$= \frac{15+2+6+9}{4}$$

$$= 8$$

$$\text{Average waiting time} = \frac{11+0+1+5}{4}$$

$$= 4.25$$

(4)

## Question: 4

Consider following Snapshot.

Process	Allocated				Max				Available			
	A	B	C	D	A	B	C	D	A	B	C	D
P <sub>0</sub>	1	2	1	2	1	0	1	2	2	3	2	1
P <sub>1</sub>	1	1	0	1	1	7	5	0				
P <sub>2</sub>	1	4	5	4	2	3	5	6				
P <sub>3</sub>	1	4	3	2	0	4	5	2				
P <sub>4</sub>	1	0	1	4	0	6	5	6				

a) What are contents of matin need?

Need matin is calculated by subtracting Allocation matin from Max matin.

Process	Need (Max - Allocation)			
	A	B	C	D
P <sub>0</sub>	0	2	0	0
P <sub>1</sub>	0	6	5	1
P <sub>2</sub>	1	1	0	2
P <sub>3</sub>	1	0	2	0
P <sub>4</sub>	1	6	4	2

b) Is the system is in safe stat.

$$m = \text{Available} = 4$$

$$n = \text{Process} = 5$$

(5)

Available = 2 3 2 1

Finish = Finish      Finish      Finish      Finish      Finish  
              0            1            2            3            4

for i = 0

Need<sub>0</sub> = 0 2 0 0

Need<sub>0</sub> < Available

0 2 0 0      2 3 2 1

So P<sub>0</sub> must be kept in safe state

Available = Available + Allocation<sub>0</sub>

= (2 3 2 1)      (1 2 1 2)  
Available = 3 5 3 3

for i = 1

Need<sub>1</sub> = 0 6 5 1

Need<sub>1</sub> < Available

(0 6 5 1)      (3 5 3 3)

So P<sub>1</sub> must be kept in safe state

Available = available + Allocation<sub>1</sub>

= (3 5 3 3)      (1 1 0 1)  
= (4 6 3 4)

(6)

for  $i = 2$ ;  $\text{Need}_2 = 1102$

$\text{Need}_2 < \text{Available}$

$1102 \quad 4634$

so  $P_2$  must be kept in safe state

$$\begin{aligned}\text{Available} &= \text{available} + \text{Allocation}_2 \\ &= (4634) \quad (1454) \\ &= (5 \ 10 \ 8 \ 8)\end{aligned}$$

for  $i = 3$

$\text{Need}_3 = 1020$

$\text{Need}_3 < \text{Available}$

$1020 \quad (5 \ 10 \ 8 \ 8)$

so  $P_3$  must be kept in safe state

$$\text{Available} = \text{Available} + \text{Allocation}_3$$

$$\begin{aligned}&(5 \ 10 \ 8 \ 8) \quad (1432) \\ &= (6 \ 14 \ 11 \ 10)\end{aligned}$$

for  $i = 4$

$\text{Need}_4 = 1642$

$\text{Need}_4 < \text{Available}$

$(1642) \quad (6 \ 14 \ 11 \ 10)$

so  $P_4$  must be kept in safe state

⑦

$$\text{Available} = \text{available} + \text{Allocation}$$

$$= \begin{pmatrix} 6 & 14 & 11 & 10 \\ & 7 & 14 & 12 & 14 \end{pmatrix} \quad \begin{pmatrix} 10 & 14 \end{pmatrix}$$

Safe Sequence will be:

$P_0, P_1, P_2, P_3, P_4$

- c) If request for process  $P_1$  arrives for  $(0, 3, 1, 1)$  can the request be granted immediately?

System arrives a request  $P_1$  for Req  $(0, 3, 1, 1)$

First we check if  $\text{Req}(P_1)$  is less than  $\text{Need}(P_1)$   
 $\rightarrow (0, 3, 1, 1) < 0, 6, 5, 1$  True

Now we check if  $\text{Req}(P_1)$  is less than Available  
 $\rightarrow (0, 3, 1, 1) < 2, 3, 2, 1$  True

So we update the value

$$\begin{aligned}\text{Available} &= \text{Available} - \text{Request} \\ &= 2, 3, 2, 1 - 0, 3, 1, 1 \\ &= 2, 0, 1, 0\end{aligned}$$

$$\begin{aligned}\text{Allocation} &= \text{Allocation}(P_1) + \text{Request} \\ &= 1, 2, 1, 2 + 0, 3, 1, 1 \\ &= 1, 5, 2, 3\end{aligned}$$

(8)

$$\begin{aligned}\text{Need} &= \text{Need}(P_1) - \text{Request} \\ &= 0.651 - 0.311 \\ &= 0.340\end{aligned}$$

Process	Allocation				Max				Need				Available			
	A	B	C	D	A	B	C	D	A	B	C	D	A	B	C	D
P <sub>0</sub>	1	2	1	2	10	12	0	0	2	0	0	0	2	0	1	0
P <sub>1</sub>	1	5	2	3	17	50	0	0	3	4	0	0	2	0	1	0
P <sub>2</sub>	1	4	5	4	23	56	1	1	0	2	0	0	1	1	0	2
P <sub>3</sub>	1	4	3	2	0	452	1	0	2	0	0	0	1	0	2	0
P <sub>4</sub>	1	0	1	4	0	856	1	6	4	2	0	0	1	6	4	2

This is the modified table.
